

SENTRY FREEDOM WIRELESS FEATURES

INPUTS

Multiple options for call placement. Wireless pendants for roaming residents. Wireless pull cord stations available in battery or remote power. Our pull cords have a secondary input to monitor any device with a contact closure. Wireless door / window transmitters for security or assurance feature. Wireless patient stations for bed ridden residents. Wireless motion detectors for automatic assurance check-ins or security monitoring. High power repeaters extend the range of the wireless transmitters allowing you to cover all areas of your facility. All devices are supervised for low battery, communications and some devices offer case tamper notification.

OUTPUTS

Sending events to various outputs gets your messages to the right person and location. Send events to local pagers for individual staff or groups. Announce calls over PC speakers or PA system. Send messages to text phone or email program. Display emergency calls on scrolling marquis. Use a voice modem to dial a number and announce an event that requires feedback response. Send calls to a wide area paging network. Outputs can be set to repeat. Escalate to a separate output if the call is not cleared in a pre-determined time frame. Use in-house network or private network at multiple locations with control at each remote.

INTEGRATION

Receive messages from other systems in your facility via serial connection. Fire alarm panels, nurse call systems, wander alert and access control systems. Customize your external serial messages by using trigger words and disqualifier words so you only get applicable messages. Send these events to any one of our available outputs so your message is directed to the right person or groups.
